ABOUT THIS MANUAL

Purpose of this manual

This manual contains the various administration topics for Natural Engineer.

It describes the Administration functions available from the Options menu within Natural Engineer. These include:

- The default Text Logic Members (TLM) used during the modification process.
- The default Global Standards that are to be applied during Impact Analysis to check applications are being maintained to site standards.

There are several administration functions required to run Natural Engineer, which are not directly administered from within Natural Engineer itself. These and their methods are also described:

- The Initialization settings within the INI file which are used to control the various processes within Natural Engineer.
- Environment sizing options.
- Transferring a Natural Engineer Repository from the mainframe environment to the PC environment.
- Supplied Impact Search Criteria sets.

Target Audience

The target audience for this manual is intended to be any User of Natural Engineer as well as Systems Administrators responsible for installing and configuring the product.

Typographical Conventions used in this manual

The following conventions are used throughout this manual:

UPPERCASE TIMES	Commands, statements, names of programs and utilities referred to in text paragraphs appear in normal (Times) uppercase.
UPPERCASE BOLD COURIER	In illustrations or examples of commands, items in uppercase bold courier must be typed in as they appear.
< >	Items in angled brackets are placeholders for user-supplied information. For example, if asked to enter <file number>, you must type the number of the required file.
<u>Underlined</u>	Underlined parts of text are hyperlinks to other parts within the online source manual. This manual was written in MS-Word 97 using the "hyperlink" feature.

The following symbols are used for instructions:

⇒	Marks the beginning of an instruction set.
□	Indicates that the instruction set consists of a single step.
1.	Indicates the first of a number of steps.

How this manual is organized

This manual is organized to reflect all the Administration options of Natural Engineer in the following chapters:

Chapter	Contents
1	Describes the various Administration functions, which control various processes within Natural Engineer.
2	Describes various configuration administration topics, which are not directly administered from within Natural Engineer itself.

Terminology

It is assumed that you are familiar with general Natural and mainframe terminology, as well as the terms and concepts relating to Microsoft Windows operating systems. This section explains some terms that are specific to the Natural Engineer product.

Analysis

The Analysis process of Natural Engineer searches application data within the Natural Engineer Repository, according to specified Search Criteria and generates reports on the search results.

Application

An Application is a library or group of related libraries, which define a complete Application. In Natural Engineer, the Application can have a one-to-one relationship with a single library of the same name, or a library of a different name, as well as related steplibs. The Application refers to all the source code from these libraries, which Natural Engineer loads into the Repository.

Browser

An Internet Browser such as Microsoft Internet Explorer or Netscape.

Category

Categories in Natural Engineer specify whether and how a Modification is applied to the Natural code. Valid categories are: Automatic change, Manual change, Reject the default Modification, No change to the data item, and the data item is in Generated Code.

A category is further broken down according to type of change (for example: Keyword, Literal, Data Item, Database Access, Definition).

Consistency

An option in the Analysis process that causes Natural Engineer to trace an Impact through the code, using left and right argument resolution to identify further code impacted by the code found.

Environment

The Environment process is the means by which Natural Engineer generates a structured view of the application code in the Natural Engineer Repository. This provides application analysis reports and inventory information on the application and is used as the basis for Impact Analysis.

Exception

An Exception is an Item identified as impacted that does not require a Modification. Where there are a few similar Exception Items, they can be treated as Exceptions, and rejected in the Modification review process. Where there are many similar (therefore not Exceptions), consideration should be given to changing the Search Criteria so they are not identified as impacted in the first place.

Generated Code

This is code which has been generated by a Natural code generator, such as Construct, and which is not normally modified directly in the Natural editor.

Impact

An Impact is an instance of a Natural code Item; e.g., data item or statement (a “hit” scored by the Analysis process) that matches the defined Search Criteria used in the Analysis process.

Iteration

An Iteration is one examination cycle of a field identified according to the specified Search Criteria. For example, one Iteration is reading the field right to left. Multiple Iterations are performed when the option of ‘Consistency’ or Multi Search is requested for Analysis, and Natural Engineer performs as many Iterations as necessary to exhaust all possibilities of expressing and tracing the field, and can be limited by a setting in the NATENG.INI file.

Library

A single library of source code, which exists in the Natural system file.

Natural Engineer Administration Guide

Modification

A Modification is a change suggested or made to an object or data item resulting in the required compliance of that object or data item. Modifications in Natural Engineer are classified according to Category and Type.

Presentation Split Process

The Presentation Split Process is a sub-function of the Object Builder function that removes screen I/O statements from current application objects and places them in generated subprograms.

Soft Link

A Soft Link is where a link between two objects has been defined using an alphanumeric variable rather than a literal constant.

Technical Split Process

The Technical Split Process is a sub-function of the Object Builder function that results in the encapsulation of each database access within the application, into a sub-program so that the application is separated into 'presentation and logic' and 'database access'.

Type

The Type of Modification available, for example: Data Item, Keyword and Literal.

TLM

Text Logic Members are used to contain the code required to support inclusion of common code into the application. An example of this is the code to include into an application before updating a database.

Related Literature

The complete set of Natural Engineer manuals consists of:

1 Natural Engineer Concepts and Facilities (NEE442-006ALL)

The Concepts and Facilities manual describes the many application systems problems and solutions offered by Natural Engineer, providing some guidelines and usage that can be applied to Natural applications.

2 Natural Engineer Release Notes (NEE442-008ALL)

The Release Notes describe all the information relating to the new features, upgrades to existing functions and documentation updates that have been applied to Natural Engineer.

3 Natural Engineer Installation Guide (NEE442-010ALL)

The Installation Guide provides information on how to install Natural Engineer on both PC and mainframe platforms.

**4 Natural Engineer Administration Guide (NEE442-040WIN)
Natural Engineer Administration Guide (NEE442-040MFR)**

The Administration Guide provides information on all the various control settings available to control the usage of the different functions within Natural Engineer.

**5 Natural Engineer Application Management (NEE442-020WIN)
Natural Engineer Application Management (NEE442-020MFR)**

The Application Management manual describes all the functions required to add Natural applications into the Repository.

**6 Natural Engineer Application Documentation (NEE442-022WIN)
Natural Engineer Application Documentation (NEE442-022MFR)**

The Application Documentation manual describes all the available functions to document a Natural application within the Repository. These functions will help enhance / supplement any existing systems documentation such as BSD / CSD / Specifications etc.

**7 Natural Engineer Application Analysis and Modification (NEE442-023WIN)
Natural Engineer Application Analysis and Modification (NEE442-023MFR)**

The Application Analysis and Modification manual describes all the available functions to carry out analysis of Natural applications; including basic keyword searches. The modification process is described and detailed to show how it can be applied to modify single selected objects within a Natural application, or the entire Natural application in one single execution.

Natural Engineer Administration Guide

**8 Natural Engineer Application Restructuring (NEE442-024WIN)
 Natural Engineer Application Restructuring (NEE442-024MFR)**

The Application Restructuring manual describes the analysis and modification functionality required to carryout some of the more sophisticated functions such as Object Builder.

**9 Natural Engineer Utilities (NEE442-080WIN)
 Natural Engineer Utilities (NEE442-080MFR)**

The Utilities manual describes all the available utilities found within Natural Engineer and, when and how they should be used.

10 Natural Engineer Reporting (NEE442-025ALL)

The Reporting manual describes each of the reports available in detail, providing report layouts, how to trigger the report and when the report data becomes available. The various report-producing mediums within Natural Engineer are also described.

11 Natural Engineer Batch Processing [Mainframes] (NEE442-026MFR)

The Batch Processing manual describes the various batch jobs (JCL) and their functionality.

12 Natural Engineer WebStar (NWS442-020ALL)

The WebStar manual describes the concepts and facilities, installation and configuration options, how to web enable a Natural application and how to create and execute Natural Short Transactions using the Natural Engineer add-on component WebStar.

13 Natural Engineer WebStar Release Notes (NWS442-008ALL)

The Release Notes describe all the information relating to the new features, upgrades to existing functions and documentation updates that have been applied to the Natural Engineer add-on component WebStar.

14 Natural Engineer Messages and Codes (NEE442-060ALL)

The Messages and Codes manual describes the various messages and codes produced by Natural Engineer.

ADMINISTRATION OPTIONS

Chapter Overview

There are several administration options available within Natural Engineer which allow Users or Systems Administrators, the facility to fine tune Natural Engineer to their site requirements, thus ensuring any use of the product will conform to a common set standard.

These administration options can be found using the Options menu, which can be accessed using option 'O' from the main Natural Engineer menu.

There are two options available:

1. **Default Text Logic Members**

Text Logic Members can be used during the modification process and allow user defined processing logic to be included as part of the modification.

2. **Global Standards**

Global Standards are used to determine if applications conform to acceptable Natural application standards. Global standards can be defined and then applied to each application on the Repository.

Default Text Logic Members

Site wide Text Logic Members (TLMs) may be specified using the Maintain Default Text Logic Members option from the Options menu.

TLMs are Natural objects with an object type of Text, containing the required processing code to be used during modification. They need to exist on either the modification library specified in the application preferences, or can be held on the Natural SYSTEM library.

After the TLMs have been saved, they need to be defined using the Default Text Logic Members option in order that Natural Engineer can recognize them and use them during the modification process.

Note: It is possible to override the default settings using the Modification Preferences option from the Modification menu. This will override the TLMs for the current selected application only.

For more information on the Modification Preferences option refer to the Natural Engineer Application Analysis & Modification for Mainframes manual.

Supplied Default Text Logic Members

Natural Engineer comes supplied with two Default Text Logic Member (TLM) objects that are used with the Nat 2.2 to Nat 3.1 conversion:

1. N31R05T1
2. N31R05T2

Note: These objects can be found on the Natural Engineer SYSNEE library and will need to be moved to either SYSTEM or modification libraries as required. If moved to the SYSTEM library, they will be available to all modification libraries.

N31R05T1

This TLM is used by the Natural 2.2 to 3.1 conversion process for the SAG05 remedy 1.

```
0010 /* -----  
0020 /* Added for Natural 2.2 to 3.1 Conversion: SAG05 Remedy 1  
0030 /* Updated by: XX-USER   Dated: XX-DATE   Time: XX-TIME using NEE  
0040 /* -----  
0050 IGNORE
```

N31R05T2

This TLM is used by the Natural 2.2 to 3.1 conversion process for the SAG05 remedy 2.

```
0010 /* -----  
0020 /* Added for Natural 2.2 to 3.1 Conversion: SAG05 Remedy 2  
0030 /* Updated by: XX-USER   Dated: XX-DATE   Time: XX-TIME using NEE  
0040 /* -----  
0050 ASSIGN XX-LOOPVAR = XX-MAXVAL
```

Default Text Logic Members Screen

All the specifications for the Default TLMs are defined using the Default Text Logic Member screen. This is accessed by selecting option 'T' (Default Text Logic Members) from the Options Menu screen.

1

Help TLM Exit Save Prev Next Opts Main

Figure 1-1 Maintain Default Text Logic Members screen

SCREEN ITEMS	DESCRIPTION
Opt	Line command options. Valid options are: 'T' Insert a new line. 'D' Delete the current line.
TLM Type	Specify what type of TLM is defined. Valid values are: START A TLM to be inserted at the Start of an Object. This is after the definition of the data items in the object. DATA A TLM that provides data items to be included in an object that has TLMs inserted. MISC A TLM that is placed at the end of the object that can contain processing, for example including common routines. COMMENT To be inserted at the start of the object to explain another TLM inserted in the object. The following variables can be specified and will be replaced at remedy execution. <ul style="list-style-type: none"> • XX-DATE, which will be translated into DD/MM/YYYY • XX-TIME, which will be translated into HH:MM:SS • XX-USER, which will contain the user-id of the person who executed modification for the object. CMPT COMM The Component comment inserted at the start of the new component subprogram that has been created. CMPT DATA Component parameter data inserted as the last parameter passed in the subprogram. The TLM data must be specifically coded in this routine and must contain the following definition first. 01 #EXTRA-PDA If a component TLM is required to pass a data item #RESPONSE between the new subprogram and the object calling it then the following is the structure for this TLM: 01 #EXTRA-PDA 02 #RESPONSE (A1)

SCREEN ITEMS	DESCRIPTION
SAG05 R1	<p>This is the default modification for empty FOR and REPEAT statement blocks. The TLM will insert the keyword IGNORE into the empty block. For Example:</p> <pre>1020 REPEAT 1030 IGNORE 1040 END-REPEAT</pre> <p><i>Note: Used in Nat 2.2 to Nat 3.1 conversion.</i></p>
SAG05 R2	<p>This TLM type can be used as an alternative to the default SAG05R1. This will comment out the empty statement block but then insert a line of code to set the applicable variable to the maximum value. For Example:</p> <p>FOR #A = 1 TO 10, will insert MOVE 10 TO #A.</p> <p>This will only be applied to a FOR loop block, a REPEAT loop block will only get commented out.</p> <p>Additionally, if this TLM type is selected in the preference screen, then prior to modification the update field button will need to be used on the Modification Element Maintenance screen to ensure the correct TLM is applied during modification.</p> <p><i>Note: Used in Nat 2.2 to Nat 3.1 conversion.</i></p>
Format	The format of the data item the TLM relates to. (Not used at present.)
Length	The length of the data item the TLM relates to. (Not used at present.)
Mode	Programming mode to which the TLM applies. Valid values are:
	Structured Structured mode
	Reporting Reporting mode
Edit Mask	The specific edit mask for the data item that the TLM relates to. (Not used at present.)
Logic Member	Name of the TLM to be used.

PFKEYS	DESCRIPTION
PF1	Activates the help function.
PF2	Displays a selection list of valid TLM Types. <i>Note: For more information on TLM Types refer to the screen item TLM Type.</i>
PF3	Exit from the current function and return to previous screen.
PF5	Saves the specified default TLM details.
PF7	Displays previous page.
PF8	Displays next page.
PF10	Displays the options available to view alternate TLM settings. <i>Note: For the Default TLM option only SiteWide TLM's are viewable.</i>
PF12	Returns to the Natural Engineer Main Menu.

Global Standards

The Global Standards option allows for the specification of application standards that are to be used as the default settings within Natural Engineer. Global Standards are used as a criteria subset of Impact Analysis when using the search keyword APPLICATION STANDARDS and will report on how an application complies with acceptable Natural application standards.

Using Global Standards, it is possible to specify the Natural application standards employed at your site, or if none exist, specify the standards that you wish to apply and adhere to. Then by loading each of your applications into the Repository and running impact analysis using the search criteria Application Standards, it is possible to report on each application's compliance.

Note: It is possible to override the default settings using the Application Standards option from the Application menu. This will override the Global Standards for the current selected application only.

For more information on the Application Standards option refer to Chapter 1 in the Natural Engineer Application Analysis & Modification for Mainframes manual.

Global Standards Definition Screen

All the specifications for Global Standards are defined using the Global Standards Definition screen.

This is accessed by selecting option ‘S’ (Global Standards) from the Options Menu screen.

A ‘Y’ in the selection column next to each option indicates that each standard is acceptable. If a selection column is blank then that standard is not acceptable.

The following Figure 1-2 illustrates the Global Standards Definition screen.

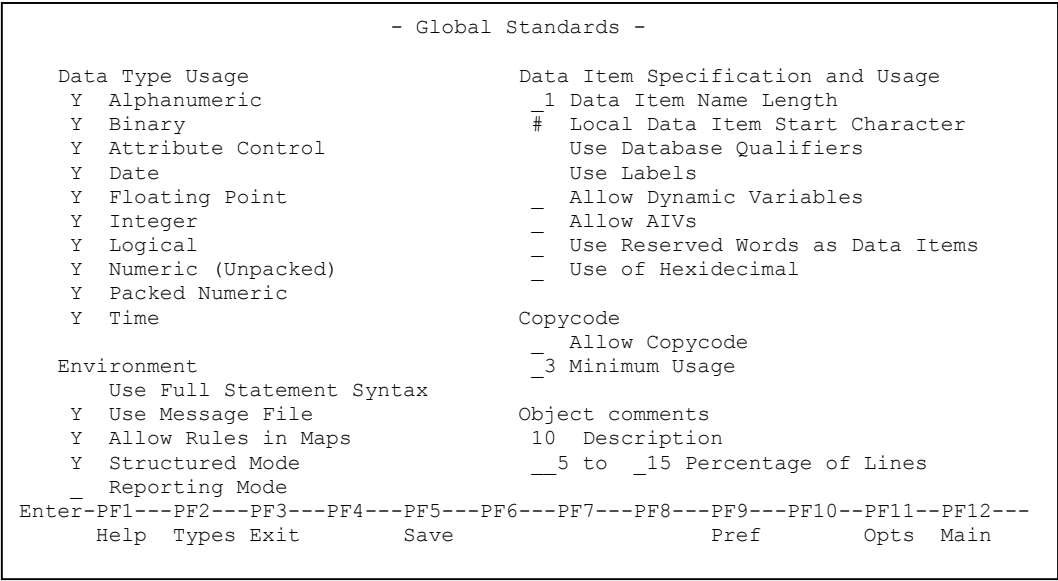

Figure 1-2 Global Standards Definition screen

SCREEN ITEMS	DESCRIPTION
Data Type Usage	<p>Identifies Data Type usage. If data items are not checked then they will be reported as non-standard. Data Types available are:</p> <ul style="list-style-type: none"> ▪ Alphanumeric ▪ Binary ▪ Attribute Control ▪ Date ▪ Floating Point ▪ Integer ▪ Logical ▪ Numeric (Unpacked) ▪ Packed Numeric ▪ Time
Environment	<p>Identifies various environmental type options. Environment options are:</p> <p>Use Full Statement Syntax Standards allow for full syntax statements to be used, rather than partial syntax. (Not currently available.)</p> <p>Use Message File Standards allow for specifying the use of a message file for messages, rather than messages embedded in the objects.</p> <p>Allow Rules in Maps Standards allow for the use of rules in maps.</p> <p>Structured Mode If Structured Mode is selected, then the Application standard is to allow Structured Mode objects.</p> <p>Reporting Mode If Reporting Mode is selected, then the Application standard is to allow Reporting Mode objects.</p>
Data Item Specification and Usage	<p>Identifies standards specific to Data Items. Data Item Specification and Usage options are:</p> <p>Data Item Name Length A number from 1 to 32 can be selected. Natural Engineer will identify data items that exceed this number.</p> <p>Local Data Item Start Character The first character required for locally defined data items.</p> <p>Use Database Qualifiers Database data items must have the associated database qualifier name.</p> <p>Use Labels Statements that can have labels, must use labels.</p>

SCREEN ITEMS	DESCRIPTION
Copycode	Allow Dynamic Variables Dynamic variables, such as &variables are permitted by standards.
	Allow AIVs Application Independent Variables are permitted by the standards.
	Use Reserved Words as Data Items If selected, data item names may also be reserved words.
	Use of Hexadecimal If selected, hexadecimal code is permitted by standards.
	Identifies standards for usage of copycode. Copycode options are: Allow Copycode If selected, applications may use Copycode objects. Minimum Usage This can be set between 0 and 99 and standards will report any copycodes that are not referenced that number of times.
Object Comments	Identifies standards for comments within an object. Object Comments options are: Description This can be 0 to 100 and requires at least that many comment lines at the start of the object. Percentage of Lines This is a percentage range from 1 to 100, which specifies the comment number standard as required to fall within that range.

PFKEYS	DESCRIPTION
PF1	Activates the help function.
PF2	Invoke the Object Type Selection pop-up window. <i>Note: For more information on Object Type Selection refer to the section Global Standards Object Types.</i>
PF3	Exit from the current function and return to previous screen.
PF5	Saves the specified Global Standards details.
PF9	Invokes the Global Standards Preferences screen.
PF11	Invokes the Standards options screen.
PF12	Returns to the Natural Engineer Main Menu.

Global Standards Preferences

The Global Standards Preferences option allows the user to limit which standards are actually checked for during Impact execution.

This is accessed by selecting ‘PF9’ (Pref) from the Global Standards Definition screen.

The Following Figure 1-3 illustrates the Standards Preferences screen.

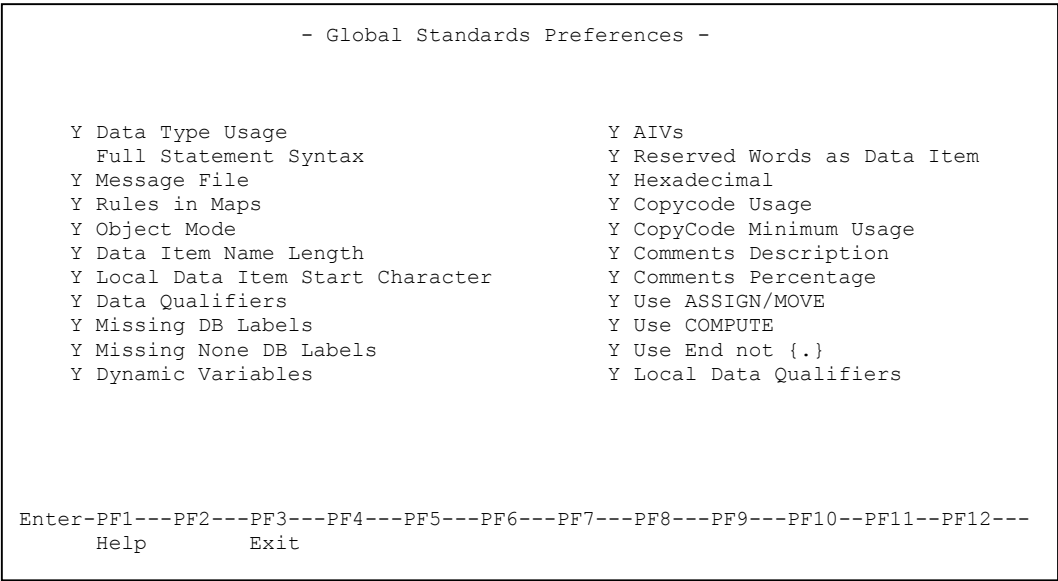

Figure 1-3 Global Standards Preferences screen

SCREEN ITEMS	DESCRIPTION
--------------	-------------

Standards	<p>Each standard is listed. A 'Y' in the selection column next to each standard indicates that the standard will be checked for. If a selection column is blank then that standard will not be referenced during Impact execution. The standards list shows:</p> <ul style="list-style-type: none"> ▪ Data Type Usage ▪ Full Statement Syntax ▪ Message File ▪ Rules in Maps ▪ Object Mode ▪ Data Item Name Length ▪ Local Data Item Start Character ▪ Database Qualifiers ▪ Missing DB Labels ▪ Missing Non DB Labels ▪ Dynamic Variables ▪ AIVs ▪ Reserved Words as Data Items ▪ Hexadecimal ▪ Copycode Usage ▪ Copycode Minimum Usage ▪ Comments Description ▪ Comments Percentage ▪ Use ASSIGN/MOVE ▪ Use COMPUTE ▪ Use END not {,} ▪ Local Data Qualifiers

Global Standards Labels and Data Manipulation Options

The Global Standards Labels and Data Manipulation options allow further standards to be checked for during Impact execution.

This is accessed by selecting 'PF11' (Opts) from the Global Standards Definition screen.

To select an option, use 'Y' in the selection column next to each option. Leave blank to ignore an option.

The Following Figure 1-5 illustrates the Standards Labels and Data Manipulation options screen.

```

- Global Standards Options -

Labels
- Convert Back References to Labels
- Generate missing DB labels
- Generate missing non-DB labels

Assign/Move
- Always use Assign
- Always use Move
Y None

- Always use Compute
- Always use End not '.'
- Qualify local variables with group name

Enter-PF1---PF2---PF3---PF4---PF5---PF6---PF7---PF8---PF9---PF10--PF11--PF12---
      Help      Exit

```

Figure 1-5 Standards Label and Data Manipulation options screen

SCREEN ITEMS	DESCRIPTION
Labels	<p>Identifies various label options. These options will generate modification details after impact execution, i.e., the modification option can be executed to add labels and/or convert back references. Label options are:</p> <p>Convert back references to labels Identifies back references, which can be converted to labels. <i>Note: When this option is selected, the Generate missing DB labels and Generate missing non-DB labels options are automatically selected. The Convert back references to labels option relies on these to create the labels first.</i></p> <p>Generate missing DB labels Identifies any Database access statements, which have no labels, associated with them. For Example: READ, FIND or HISTOGRAM. <i>Note: This option is mutually exclusive to both the Convert back references to labels and Generate missing non-DB labels options.</i></p> <p>Generate missing non-DB labels Identifies any non-Database access statements which have no labels associated with them. For Example: FOR and REPEAT loops. <i>Note: This option is mutually exclusive to both the Convert back references to labels and Generate missing DB labels options.</i></p>
ASSIGN/MOVE	<p>Identifies the use of ASSIGN or MOVE statements. ASSIGN/MOVE options are:</p> <p>Always use ASSIGN Any MOVE statements are located and reported.</p> <p>Always use MOVE Any ASSIGN statements are located and reported.</p>

SCREEN ITEMS	DESCRIPTION
Miscellaneous	<p>Identifies standards for miscellaneous options. Miscellaneous options are:</p> <p>Always use COMPUTE Any ASSIGN statements containing arithmetic constructs are located and reported. For Example:</p> <p>ASSIGN #TOTAL = #NET-TOTAL + 1</p> <p>Always use END not {.} Any use of ‘.’ as the END statement is located and reported.</p> <p>Qualify local variables with group name Any local variables that are defined within a group and have no group name qualifier are located and reported. For Example:</p> <p>0100 01 #TAX-GROUP 0110 02 #TAX-RATE (N1.5) 0120 02 #TAX-RATE2 (N3) :::: 0300 COMPUTE #TOTAL-PAY = #ITEM-COST * #TAX-RATE #TAX-RATE at line number 0300 would be reported as it should have the group high level qualifier #TAX-GROUP prefix, i.e., #TAX-GROUP.#TAX-RATE.</p>

PFKEYS	DESCRIPTION
PF1	Activates the help function.
PF3	Exit from the current function and return to previous screen.

CONFIGURATION

Chapter Overview

This chapter describes some of the considerations and modifications you can make before running the Natural Engineer processes.

The topics that are covered are:

1. Initialization Settings
2. Environment sizing
3. Transferring Repository
4. Supplied Impact Search Criteria

Initialization Settings

The various configuration options for Natural Engineer are held as initialization parameters contained in a text member: `###CINI`. This text member resides in the Natural Engineer library `SYSNEE`.

The format within the `###CINI` text member consists of labels used to group the various parameters to the applicable function area within Natural Engineer.

The `###CINI` file can be accessed by logging onto the `SYSNEE` library and editing object `###CINI`.

###CINI Parameters

The following table lists the entire ###CINI parameters and their respective group headings.

The notation used in the table:

[GROUP HEADER]	Group headers will be surrounded by square brackets.
PARAMETER=	Each parameter is named and followed by an equal's sign.

Group Header / Parameter	Description
[APPLICATION]	
LIBRARY=AAAAA	Application name to be processed.
PROGRAM=*	Used to limit some reports.
TASKID=TTTT	The Task id used for Task Scheduler batch tasks.
[LOAD]	
REPLACE=Y	Default=Y Will replace objects if found on the Repository during the Load process.
[EXTRACT]	
ELETAB=	Default=20000 Maximum number of parsed elements per object.
VARTAB=	Default=2000 Maximum number of variable definitions per object.
OBJTAB=	Default=20000 The number of unique objects in the base library.

Group Header / Parameter	Description
REFTAB=	Default=10000 The number of unique referenced objects in the base library.
GBLDDM-TAB=	Default=500 The number of unique DDM objects to be extracted per application.
DDMCACHE=	Default=0 Maximum number of DDM definitions held in memory. If this value is increased then the performance of the Extract process may be enhanced. Suggested values 0-10
PERF-PTAB=	Default=300 Amount of PERFORM statements held in internal table per object.
PERF-DTAB=	Default=130 Amount of DEFINE subroutine statements held in internal table per object.
ADABAS-SHORT-NAMES=	Default=N This ensures that Natural Engineer will identify the 2 byte mnemonics and tie them up with the DDM. <i>Note that this setting must only be used when the code does contain Adabas Short Names.</i> Possible values Y,N
[IMPACT]	
IOR=	Default=Y Used when Consistency is selected for Analysis. If set to Y, data elements are tracked across object boundaries following the impact process. IOR=ONLY will ensure that Natural Engineer only performs inter object tracing. Please note that this setting should only be used following a successful multiple impact or to restart a previously failed IOR process. Possible values Y,N, ONLY

Group Header / Parameter	Description
TRACKING=	<p>Default=N</p> <p>Used when Consistency or Multi Search is selected for Analysis. It controls the tracking direction for a variable.</p> <p>If set to F, a variable is tracked in a forward direction, showing all the derivatives being populated from the variable. If set to B, a variable is tracked in a backward direction, showing where the variable and derivatives have been populated. If set to N, both the forward and backward directions will be shown.</p> <p>Possible values N,F,B</p>
IOR-LIMIT=	<p>Default=20</p> <p>Used when Consistency is selected for Analysis.</p> <p>This is the number of Iterations that IOR will track objects across object boundaries.</p>
REDEFMAP=	<p>Default=Y</p> <p>If set to Y, multiple redefines are tracked.</p> <p>Possible values Y,N</p>
CONSISTENCY=	<p>Default=N</p> <p>If set to Y, will mark the Consistency selection box with a tick (select) on the Impact Criteria screen. This will cause Analysis to trace code identified for further impact on other code.</p> <p>Possible values Y,N</p> <p><i>Note: For more information on the consistency option refer to Chapter 1 in the Natural Engineer Application Analysis and Modification for Mainframes manual.</i></p>
START=	<p>Used when Consistency is selected for Analysis.</p> <p>Start object name for running concurrent Impact Analysis jobs or to start Impact Analysis after failure.</p>
END=	<p>Used when Consistency is selected for Analysis.</p> <p>End object name for running concurrent impact Analysis jobs. This should be set to blank if running impact Analysis after failure.</p>

Group Header / Parameter	Description
MODE=	Default=RE-ENG This is used to control the type of impact Analysis that will be used.
GLOBAL_DATAITEM=	Default=N Used when consistency is selected for analysis and impacts have been made to Global Data Areas. By setting this flag to Y, Natural Engineer will track these fields, and derivations of these fields, until all possible impacts have been identified.
DDM_DATAITEM=	Default=N Used when consistency is selected for analysis and impacts have been made to DDMs. By setting this flag to Y, Natural Engineer will track these fields, and derivations of these fields, until all possible impacts have been identified.
LANG=	Default=01 Used for Multi Search. Default multi search criteria may be created and saved in DATA directory as ###DEFnn.ISC, where nn refers to the language code.
VERSION=VV	Used to indicate the Impact Version number applicable.
[MODIFY]	
COM_DA_AUTO=	Default=NEE Mod The comment line for an automatic Data Area change.
COM_DA_MAN=	Default=NEE The comment line for a manual Data Area change.
COM_AUTO=	Default=NEE Modified The comment line for an automatic non Data Area change.
COM_MAN=	Default=NEE Manual The comment line for a manual non Data Area change.

Group Header / Parameter	Description
COM_NOT=	Default=NEE not Modified The comment line for no change required.
COM_ERR=	Default=NEE not Modified (logic error) The comment line for an error in processing.
COM_COMPLEX=	Default=NEE not Modified (complex) The comment line for a Modification that could not be completed.
COMMENT-OLD-LINE=	Default=Y If set to Y, then the old code will be commented out and left in the modified object. If set to N, then the old code is deleted from the modified object.
COM_OLD_CODE=	Default=NEE Old Code There is now the ability for the user to customize the wording of the comment that is placed into the code during modification to indicate old code.
COM_LITERAL_WARN=	Default=: WARNING! CHECK LITERAL VALUE If this is present then a warning will be added to the code if a literal needs to be modified. If this parameter is not already present, then no message is added to the code, otherwise just before the line gets changed, you will get the field name involved with a literal compressed with the text for COM_LITERAL_WARN. Please note that the maximum length for a Modification comment is 32 bytes.
MARK_MANUAL_CW=	Default=Y If this is set to Y then a warning will be added to the modified code if manual modification is required to be performed by the user. Additionally the literal string, associated with the field name in the statements are flagged if the COM_LITERAL_WARN is set. The literal string for manual fields are NOT marked if the MARK_MANUAL_CW=N. Possible values Y,N

Group Header / Parameter	Description
ADD_DO_DOEND=	<p>Default=N</p> <p>This parameter will insert DO/DOEND logic into every IF statement in a reporting mode object if not already present. This is required to ensure that certain reengineering modification is performed correctly in complex IF/ELSE statements in reporting mode objects. This parameter is used for reengineering of reporting mode objects only.</p> <p>Possible values Y,N.</p>
COMPONENT_OBJECT_NAME=	<p>Default=#####*%</p> <p>Used in Object Builder. This is the primary pattern mask used to determine the name of the generated objects.</p> <p><i>Note: For more information on the pattern mask refer to the chapter on Object Builder in the Natural Engineer Application Restructuring for Mainframes manual.</i></p>
COMPONENT_OVERFLOW_NAME=	<p>Default=#####*%</p> <p>Used in Object Builder. This is an overflow pattern mask used when the primary pattern mask has been exhausted.</p> <p><i>Note: For more information on the pattern mask refer to the chapter on Object Builder in the Natural Engineer Application Restructuring for Mainframes manual.</i></p>
OVERWRITE_EXISTING=	<p>This parameter allows for a setting to be set when Task Scheduler is used to execute modification. This setting will determine what is to happen with existing objects in the modification library.</p> <p>Possible values: YA – yes to all NA – no to all C – cancel</p>
[REPORTER]	
DELIMITER-CHAR=	<p>Delimiter Character for CSV Files.</p> <p>Default = ,</p>

Environment Sizing

This section describes the environment sizing considerations based on one million lines of source code.

Hard Disk Space

Natural Engineer writes an Extract file (“application name”.OUT) which contains the neutral records for loading into the Natural Engineer Repository.

- For the PC platforms, 1 million lines of code require 120 Meg of hard disk space.
- For the MVS platform, 1 million lines of code requires 130 cylinders of disk space. This file can also be written to tape.

Adabas Database

Space Requirements

The main consideration when estimating space requirements for Natural Engineer depends upon the complexity of the code, for example how many include routines are present (LDAs, GDAs, PDAs, COPYCODEs etc). The more included routines, the larger the Repository size.

An average record size is 135 bytes.

For 1 million lines of code and more, this would equate to the following:

	Natural Studio	MVS Mainframe	
	Adabas 2.2.3 on Windows	3390	3380
ASSO	220 MB	520 cyls	620 cyls
DATA	250 MB	340 cyls	365 cyls
WORK	50 MB		

2

Natural Engineer Administration Guide

Nucleus/ADARUN Parameters

The nucleus/ADARUN parameter settings listed below do not depend on the number of lines of code being processed. However, they reflect the recommended minimum set for any Natural Engineer Repository.

Parameter	Setting	Comment
LQ	30,000	
LP	1,600	
LU	16,000	
LOGGING		Set to blank.
LFP	40,000	
LS	20,000	
TNAA	7200	
TNAE	7200	
TNAX	7200	
PLOG	NO	

Transferring Repository

Some sites or projects may not have sufficient network capability to employ an Entire Network solution. However, you may want to use the processing power of the mainframe with the GUI capabilities of the PC.

One method of achieving this is to duplicate the mainframe Natural Engineer Repository, following the EXTRACT, LOAD and IMPACT stages, to the PC.

Transferring Natural Engineer Repository from Mainframe to PC

The following steps describe the processes involved to achieve a successful transfer:

To transfer the Natural Engineer Repository from the mainframe to the PC environment requires the following steps to be followed:

1. Check the Natural Engineer Repository File layouts
2. Decompress the file on the mainframe
3. Transfer the decompressed file to the PC
4. Create a Repository file on the PC
5. Compress and load the decompressed mainframe file onto the PC.

Each of these steps is described in more detail below.

Check Natural Engineer Repository File Layouts

Prior to beginning the process, the file layouts of the Natural Engineer Repository file on the PC and the Mainframe need to be checked to ensure that they are identical.

To do this run ADAREPs on the mainframe and the PC and perform a visual check. If they are not identical then they need to be brought into line.

Decompress the File on the Mainframe

The first stage in the process is to decompress the Natural Engineer Repository data on the mainframe.

Example ADACMP JCL (MVS) to Decompress File on the Mainframe

```

000001 //XGSLIDE JOB CLASS=K,NOTIFY=XGS1,MSGCLASS=X,MSGLEVEL=(1,1)
000002 //*
000003 //JOB LIB DD DSN=RZDBA.DB177.NEWLOAD,DISP=SHR
000004 // DD DSN=RZDBA.DB177.LOAD,DISP=SHR
000005 //*
000006 //DECOMP EXEC PGM=ADARUN,
000007 // REGION=4M,
000008 // COND=(1,LT)
000009 //DDCARD DD *
000010 ADARUN PROG=ADACMP,SVC=249,DEVICE=3390,DB=177
000011 /*
000012 //DDASSOR1 DD DSN=DB177.SYSF.ASSOR1,DISP=SHR
000013 //DDDATAR1 DD DSN=DB177.SYSF.DATAR1,DISP=SHR
000014 //DDWORKR1 DD DSN=DB177.SYSF.WORKR1,DISP=SHR
000015 //DDAUSBA DD DSN=XGS1.DECOMP.F065.DATAV,
000016 // DISP=(,CATLG,DELETE),UNIT=DISK,
000017 // VOL=SER=EUP001,
000018 // SPACE=(CYL,(3,2),RLSE)
000019 //DDFEHL DD SYSOUT=*
000020 //DDPRINT DD SYSOUT=*
000021 //SYSUDUMP DD SYSOUT=*
000022 //DDDRUCK DD SYSOUT=*
000023 //DDKARTE DD *
000024 ADACMP DECOMPRESS INFILE=65
000025 /*

```

Example of the Decompressed File created

DATA SET NAME : XGSL1.DECOMP.F065.DATAV

GENERAL DATA

VOLUME SERIAL : EUP001
 DEVICE TYPE : 3380
 ORGANIZATION : PS
 RECORD FORMAT : VB
 RECORD LENGTH : 23472
 BLOCK SIZE : 23476
 ALLOCATION TYPE: CYL
 1ST EXTENT : 2
 SECONDARY : 2
 SECURITY : NONE

CURRENT-ALLOCATION
 ALLOCATED CYLINDERS: 2
 ALLOCATED EXTENTS : 1

CURRENT UTILIZATION
 PERCENT USED: 97

CYL 0 TRK

Example of the Decompress Job Output

A D A C M P V6.2 SM1 DBID = 00177 STARTED 1999-02-01
 14:21

PARAMETERS:

ADACMP DECOMPRESS INFILE=65

DECOMPRESS PROCESSING STATISTICS:

 NUMBER OF RECORDS READ 911
 NUMBER OF INCORRECT RECORDS 0
 NUMBER OF DECOMPRESSED RECORDS 911

A D A C M P TERMINATED NORMALLY 1999-02-01
 14:21

Transfer the Decompress File to the PC

Now transfer the decompress file that you have just created to the PC, in Binary, non-translated format.

FTP is recommended for this transfer.

Create Repository File on PC

If a Repository file does not currently exist on the PC then one needs to be created using the FDT file supplied in X:\PROGRAM FILES\SOFTWARE AG\NATURAL ENGINEER\4.4.2\ADA folder (where X is the directory on which Natural Engineer was installed).

This would typically be performed by using the DBA Workbench utility.

Compress and Load File on the PC

The next stage is to compress and load the decompressed file onto the Repository file on the PC.

The following steps are a guide to this process.

1. Highlight the file within DBA workbench.

The following Figure 2-1 illustrates the DBA Workbench file list screen with the Repository file selected.

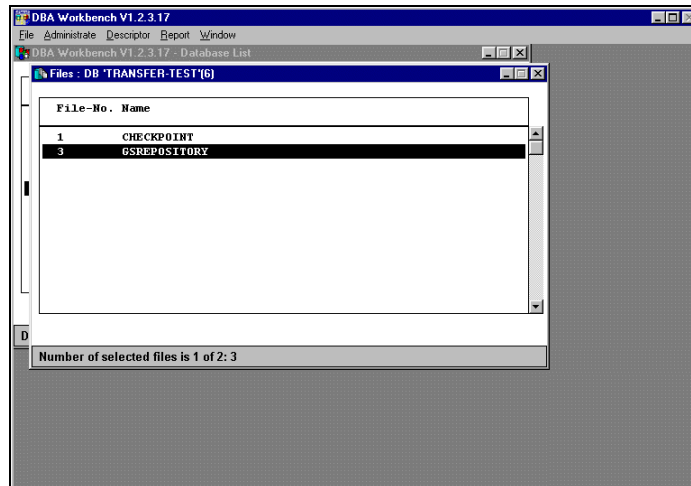

Figure 2-1 DBA Workbench file list screen

2. Select, File, Compress from the main menu:

The following Figure 2-2 illustrates the DBA Workbench file compress option.

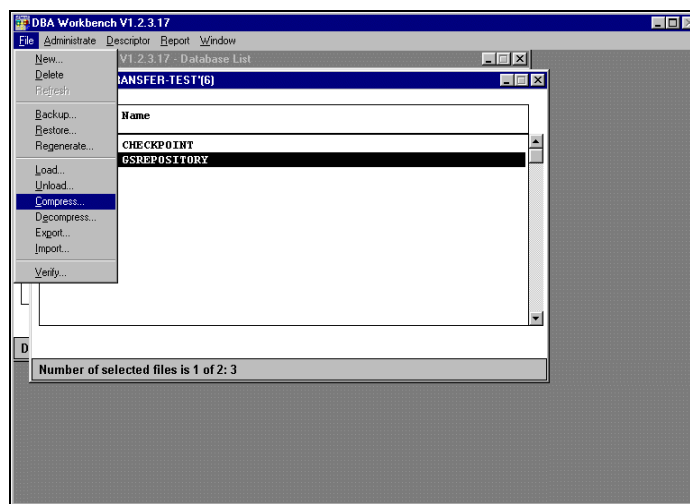

Figure 2-2 DBA Workbench file compress option

2

Natural Engineer Administration Guide

3. The following parameters should be entered:

The Data file is the decompressed file you copied to the PC from the mainframe.

The following Figure 2-3 illustrates the Compress File options screen within DBA Workbench.

The screenshot shows the 'Compress' dialog box with the following settings:

- Input:**
 - Data: C:\DECOMP.F065.DATAV
 - FDT: (empty)
 - Record Structure: IBM-Host [FTP], VAX
 - ☐ User ISNs
 - ☐ Comma Separator
 - Number of Records to Skip: (empty)
 - Max. Number of Records to Process: (empty)
- Temporary Data:**
 - Temporary Data: c:\sag\ada\adb006\TMP.006
- Output:**
 - Data: c:\sag\ada\adb006\DTA.006
 - DVT: c:\sag\ada\adb006\DVT.006
 - ☐ Compress to Single File
 - ☒ Load Compressed Data
- Source Architecture:**
 - EBCDIC
 - IBM_370_FLOATING
 - High_Order_Byte_First

Buttons at the bottom: OK, Cancel, Fields..., Help.

Figure 2-3 Compress File screen

4. The LOAD screen will be shown

The following Figure 2-4 illustrates the Load File options screen within DBA Workbench.

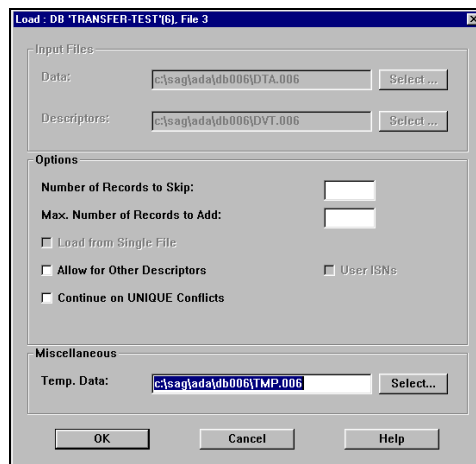

Figure 2-4 Load File screen

Click OK to start the Compress and Load process,

5. The Compress and Load jobs should produce three output windows. Sample output in each is shown below.

The first window is showing the conversion of EBCDIC to ASCII format:

- Start converting C:\DECOMP.F065.DATAV
- converting 911 records

The second is the output from ADACMP, which is compressing the data:

```
%ADACMP-I-STARTED,      01-FEB-1999 14:14:10, Version 2.2.3.22, (WINDOWS 95)
%ADACMP-I-NACTL, ADABAS nucleus active on local node

Descriptor summary:

Descriptor VM :          80 bytes,          10 occ
Descriptor S2 :        19,005 bytes,        905 occ
Descriptor S3 :        22,625 bytes,        905 occ
Descriptor S5 :          528 bytes,         28 occ

```

Common Load Problems

NAT3048 received during Load

This has two possible causes. The first is that someone is logged on using the file. The solution here is to log them off during the Load process.

It is also received if a previous attempt to Load the file failed. To clear this, highlight the database and from the main menu, select DATABASE, OPERATE, RESET UCB as shown below:

The following Figure 2-5 illustrates the option Reset UCB within DBA Workbench.

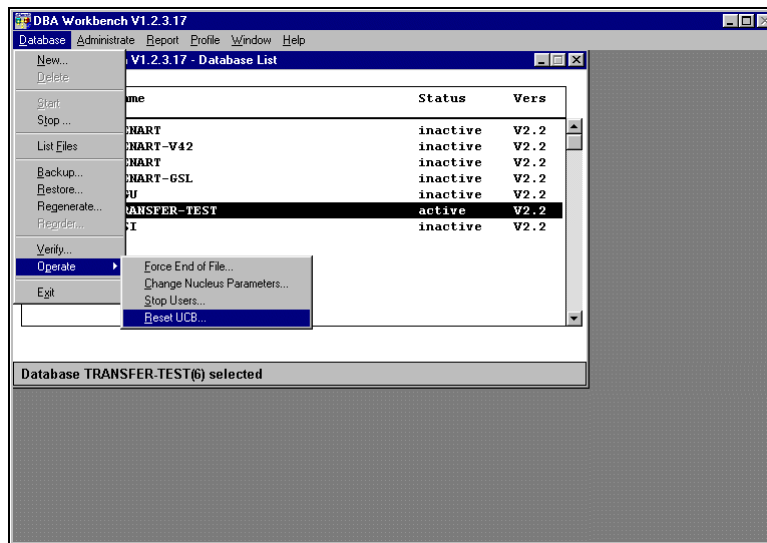

Figure 2-5 Reset UCB option

This will then present a list of items that require resetting. Select the appropriate entry to reset.

Supplied Impact Search Criteria

Natural Engineer comes supplied with several Impact Search Criteria sets, which are loaded into the Repository as part of the Natural Engineer installation process.

The installed Impact Search Criteria sets are:

1. ###DEF01
2. CODEINT
3. OBJPRES
4. OBJTECH

###DEF01

This is the default search criteria used during the specification of impact search criteria when the search keyword MULTI SEARCH has been selected.

The contents of this file are:

```
* Multi Search Options
* A Absolute Exclude
* I Include
* X Exclude
* IL Include Literal
* XL Exclude Literal
* * Comment
* IA Include Attribute
* XA Exclude Attribute
```

This may be customized by the User.

CODEINT

The CODEINT set contains the impact search criteria set for the search keyword INTERNATIONALIZATION.

This file can be used by using 'PF4' (GetSa) option on the Impact Criteria Summary screen.

Note: For more information on this search keyword refer to the Natural Engineer Application Analysis & Modification for Mainframes manual.

OBJPRES

The OBJPRES set contains the impact search criteria set for the search keyword OBJECT BUILDER when executing the Presentation layer option.

This file can be used by using 'PF4' (GetSa) option on the Impact Criteria Summary screen.

Note: For more information on this search keyword refer to the Natural Engineer Application Restructuring for Mainframes manual.

OBJTECH

The OBJTECH set contains the impact search criteria set for the search keyword OBJECT BUILDER when executing the Technical Split option.

This file can be used by using 'PF4' (GetSa) option on the Impact Criteria Summary screen.

Note: For more information on this search keyword refer to the Natural Engineer Application Restructuring for Mainframes manual.

Limits

Due to constraints on different platforms, Natural Engineer has to have certain limits.

It is possible to customize these limits to suit the environment being used, for the following options:

Extract

Option	Default Value	User Modifiable	How to modify
Amount of DDMs per Object	75	NO	
Amount of Views per Object	100	NO	
Maximum number of parsed elements per Object	10000	YES	The ELETAB= parameter in section [EXTRACT] of the ###CINI text member.
Maximum number of variable definitions per object.	1000	YES	The VARTAB= parameter in section [EXTRACT] of the ###CINI text member.
Maximum number of unique objects in the base library.	20000	YES	The OBJTAB= parameter in section [EXTRACT] of the ###CINI text member.
Maximum number of unique referenced objects in the base library.	10000	YES	The REFTAB= parameter in section [EXTRACT] of the ###CINI text member.
Maximum number of unique DDM objects per application.	500	YES	The GBLDDM-TAB= parameter in section [EXTRACT] of the ###CINI text member.
Amount of objects to retrieve from steplibs	1000	YES	The STEPTAB= parameter in section [EXTRACT] of the ###CINI text member.
Maximum number of DDM definitions in memory	0	YES	The DDMCACHE= parameter in section [EXTRACT] of the ###CINI text member.

Option	Default Value	User Modifiable	How to modify
Amount of PERFORM statements per object	300	YES	The PERF-TAB= parameter in section [EXTRACT] of the ###CINI text member.
Amount of DEFINE subroutines held per object	130	YES	The PERF-DTAB= parameter in section [EXTRACT] of the ###CINI text member.

Impact

Option	Default Value	User Modifiable	How to modify
Amount of Impact Versions per Application.	99	NO	
Maximum number of iterations that IOR will track objects across Object boundaries when consistency used for Analysis.	20	YES	The IOR-LIMIT= parameter in section [IMPACT] of the ###CINI text member.

General

Option	Default Value	User Modifiable	How to modify
Length of Directory path name when importing external files e.g. Impact Search Criteria (*.IRE)	64	NO	
Amount of Entry Points allowed to be specified	29	NO	

Option	Default Value	User Modifiable	How to modify
Maximum amount of Objects loaded into a list box for selection at one time	200	YES	The LISTBOXMAX= parameter in section [LIMITS] of the ###CINI text member.
